

MEDICINES ACROSS EURASIA

This workshop brings together leading experts in the history of medicine and in digital humanities, to develop a digital corpus of sources for the history of medicine from around the world, in Chinese, Sanskrit, Arabic, Hebrew, Greek and Latin. In this workshop we will hear about cutting-edge collections and tools for hosting, sharing and analyzing digital corpora, as well as the current state of affairs for medical corpus collections, both online and in print. Together we will consider the problem of the “philology of things,” that is, how to develop digital means to identify common material objects that are described in different languages across time and space. We will also work towards a common reference architecture for pre-modern medical texts across the Eurasian traditions, as a model for linking subject-specific, polyglot collections across multiple corpora.

The third day will also include a hands-on demonstration of DocuSky, a tool for developing personal databases, as part of an experiment to move beyond Sinitic scripts to work in multiple languages. This toolset forms the basis for the first attempts to analyse the Daoist and Buddhist canons in common at scale.
